

Multimodal AI Data Annotation & Quality Review

Image Annotation Quality Report

This project documents bounding-box annotation and quality review performed on a dataset of images containing people and everyday objects. Annotations were created using CVAT and subsequently reviewed using Python-based validation and visual quality checks.

Metric	Result
Images reviewed	16
Total bounding boxes	92
Average annotations per image	5.75
Invalid boxes	0
Out-of-bounds boxes	0
Images visually reviewed	16 / 16

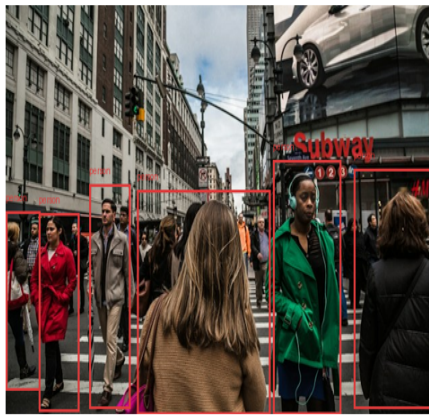

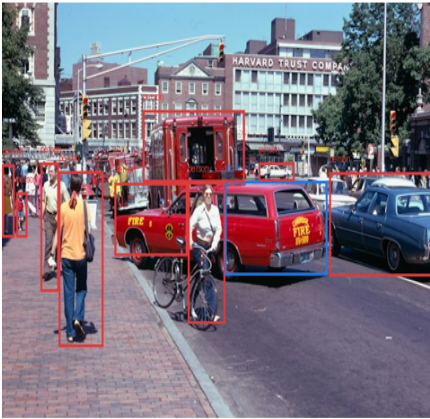

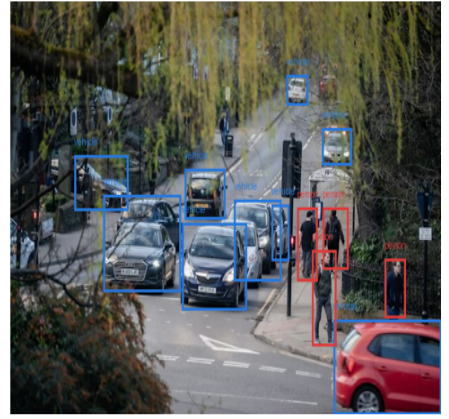

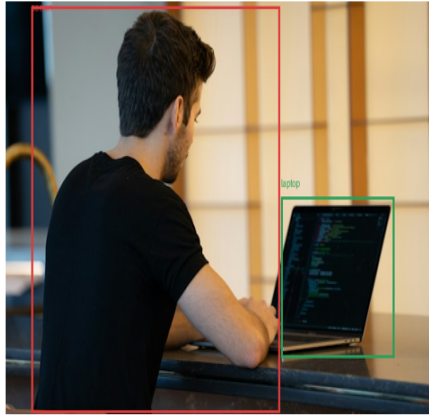

Annotation Classes

Class	Bounding Boxes
Person	67
Vehicle	18
Laptop	4
Phone	3

Quality-Control Process

The exported CVAT XML was parsed with Python to verify annotation coordinates and image boundaries. All 92 bounding boxes passed the coordinate validation checks, with no invalid or out-of-bounds boxes. All 16 images were subsequently reviewed visually for box placement and label consistency, with no obvious annotation errors identified.

Visual Annotation Evidence

The examples above show the bounding-box annotations applied to people and objects in the image dataset.

Tools Used

CVAT • Python • XML • Pandas • Google Colab

Project Outcome

The completed dataset contains 92 validated bounding-box annotations across 16 images and four object classes. The annotation data was validated programmatically and reviewed visually before being prepared for portfolio documentation.
